

Data on Death Registrations Illustrates Issues with Ontario's Records Maintenance*

Chloe Thierstein

24 January 2023

First sentence. Second sentence. Third sentence. Fourth sentence. - The abstract should be three or four sentences. The abstract must tell the reader the top-level finding. What is the one thing that we learn about the world because of this paper?

Introduction

two or three paragraphs of content. and there should be an additional final paragraph that sets out the remainder of the paper

You can and should cross-reference sections and sub-sections. For instance, Section @ref(data). Quarto automatically makes the sections lower case and adds a dash to spaces to generate labels, for instance, Section @ref(first-discussion-point).

During the period of 2011 and 2020, it is estimated that on average just under 100 thousand people died each year in Ontario, Canada (Statistics Canada n.d.). The province of Ontario represents the location of a large portion of deaths in Canada as it takes on an estimated 37% of all deaths in Canada from 2011-2020 (Statistics Canada n.d.). From 2011 to 2020, the population in Ontario has grown from over 13 million to just under 15 million (Statistics Canada n.d.). Significantly, the city of Toronto makes up approximately 44% of the population of Ontario (Statistics Canada n.d.).

In this paper I will be analyzing death registry data from four civic centers in the greater Toronto area, Etobicoke, North York, and Scarborough. First, I will compare rates of death

*Code and data are available at: https://github.com/cthierst/death_registry_analysis.git.

registration from these civic centers over the period of 2011-2020. Next, I will compare rates of death registration against place of death in order to discuss the rate of deaths inside and outside the Toronto city limits. Finally, I will discuss trends in death registrations from each civic center.

Data

data section should thoroughly and precisely discuss the source of the data and the bias this brings (ethical, statistical, and otherwise). comprehensively describe and summarize the data using text, graphs, and tables must be made iwth knitr or gt. graphs must show the actual data, or as close to it as possible, not summary statistics. (Graphs and tables should be cross-references in the text e.g., ‘Table 1 shows...’)

Analysis for this paper utilizes R the statistical programming language (R Core Team 2020), along with several packages. These packages are, tidyverse (Wickham et al. 2019), janitor (Firke 2021), and dplyr (Wickham et al. 2022). The data I am analyzing come from Open Data Toronto and it is imported using the opendatatoronto package (Gelfand 2022). **All figures in this paper have been created using ggplot2 (Wickham 2016) and the tables have been created with knitr (Xie 2023) and kableExtra (Zhu 2021), packages. The color styles in my graph were created by using the RColorBrewer (Neuwirth 2022) package and any graph combinations were made using the Patchwork (Pedersen 2022) package.**

The data I am analyzing comes from Registry Services staff located in three of the civic centers (Etobicoke, North York, Scarborough) and

“This dataset includes information relating to the registration of deaths documented by Registry Services staff located in four of the civic centres (Scarborough, North York, Toronto and Etobicoke). Registration of death data is entered into the Registry Services Tracking System (RSTS), from which aggregate statistical information is generated to create the dataset. The dataset resides in an Oracle database in the City’s environment.

The data I am analyzing comes from death registrations which are entered into the Registry Services Tracking System (RSTS) by Registry Services staff located at three of the civic centres (Etobicoke, North York, Scarborough) .

Open Data Toronto (2023)

The dataset is created in support of the Vital Statistics Act, which is a Provincial legislation. The dataset also supports the City’s operational requirements and business functions.” (Gelfand 2022)

“_id = unique row identifier for Open Data database

civic_centre = civic centre code

death licenses = number of deaths registered in the month

place_of_death = place where death occurred

time_period = month death registered” (Gelfand 2022)

(Figure 1)
